## gcov

- `gcc -fprofile-arcs -ftest-coverage a.c b.c # --coverage`
- `compile-time -fprofile-arcs`  $\Rightarrow$  `a.gcno b.gcno` (notes file)
- `./a.out`  $\Rightarrow$  `a.gcda b.gcda` (count data file)
- `gcov a.c #` or `a.`  $\Rightarrow$  `a.c.gcov`
- `gcov b.gcno #` or `b.`  $\Rightarrow$  `b.c.gcov`
- `gcov -h`

## lcov

- <https://github.com/linux-test-project/lcov>, gcov's graphical front-end
- `lcov --gcov-tool gcov -c -d . -o a.info`
- `genhtml a.info -o html`

## References

```
% lcov --gcov-tool gcov-9 -c -d . -o a.info
Capturing coverage data from .
Found gcov version: 9.3.0
Using intermediate gcov format
Scanning . for .gcda files ...
Found 2 data files in .
Processing b.gcda
Processing a.gcda
Finished .info-file creation
% genhtml a.info -o html
Reading data file a.info
Found 2 entries.
Found common filename prefix "/tmp"
Writing .css and .png files.
Generating output.
Processing file c/a.c
Processing file c/b.c
Writing directory view page.
Overall coverage rate:
  lines.....: 100.0% (4 of 4 lines)
  functions...: 100.0% (2 of 2 functions)
```

## Compatibility

- .gcno/.gcda format changed several times: GCC 3.4, 4.7, 4.8, 8, 9

```
% gcc-9 --coverage a.c; ./a.out; gcov-10 a.  
a.gcno:version 'A93*', prefer 'B00e'  
a.gcda:version 'A93*', prefer version 'B00e'  
File 'a.c'  
Lines executed:100.00% of 2  
Creating 'a.c.gcov'
```

```
% gcov-8 a.  
a.gcno:version 'A93*', prefer 'A84*'  
a.gcno:no functions found  
a.gcda:version 'A93*', prefer version 'A84*'
```

## gcov in Clang

- `clang --coverage # -fprofile-arcs -ftest-coverage`
- `clang --coverage -Xclang -coverage-version='408*' gcov 4.8 7 compatible`
- `instrumenter (write .gcno, generate calls into runtime) ⇔ gcc/coverage.c`
- `runtime (write .gcda) ⇔ libgcov.a (libgcc/libgcov-driver.c & friends)`
- `llvm-cov gcov ⇔ gcov`

```
# Position in the legacy pass manager pipeline
% clang --coverage -mllvm -debug-pass=Arguments -c a.c
Pass Arguments: -tti -targetlibinfo -ee-instrument
Pass Arguments: -tti -targetlibinfo -assumption-cache-tracker -profile-summary-info -insert-
gcov-profiling -strip -forceattrs -basiccg -always-inline
Pass Arguments: -tti -targetlibinfo -targetpassconfig ... -livedebugvalues -x86-seses -cfi-
instr-inserter -x86-lvi-ret -lazy-machine-block-freq -machine-opt-remark-emitter
# Close to -finstrument-functions, -fprofile-instr-generate
```

在 new pass manager 中的位置差不多。问题：instrument 部分位置太靠前了，而生成的函数必须提前来利用  
后续的优化

## Instrumenter

- 添加一个 static constructor `__llvm_gcov_init`, 呼叫 runtime `llvm_gcov_init`
- 每个函数: `@__llvm_gcov_ctr = internal global [$n x i64] zeroinitializer, $n 为边数`
- basic block 转移时插入指令修改 `__llvm_gcov_ctr` 元素
- `__llvm_gcov_writeout`: 输出所有 `@__llvm_gcov_ctr`

## llvm\_gcov\_init

- 定义在 libclang\_rt.profile-x86\_64.a(GCDAProfilng.c.o)
- 接收 writeout, flush, reset 三个 callbacks
- writeout: 写 .gcda
- reset: 清零 counters
- \_\_gcov\_flush=writeout+reset (无用, GCC 11 被移除)
- 设置 atexit hook, 在程序退出时呼叫 writeout

## llvm-cov gcov

- gcov 3.4 10 + clang's fake gcov 4.2 format
- `-i, --intermediate-format`
- `-t, --stdout`

## Future work

- 减少 counters 数目：后移 pass
- 实现目前忽略的字段
- gcov 8 模仿 coverage mapping，可以显示不同 template instantiations 的行计数
- llvm-cov gcov 准确支持 GCC $\geq$ 9 行计数
